

- Discussed the use of async functions to generate images during a user's session from the time they log on. We'll see if we implement that or not.
- Need to update users stories to have a checklist of items to do on that story. The story for login has an example of this.
- Need to have our database framework completed by next week. We can always make adjustments to it but we should know how many databases we are using and what's going to go into them.
- Each member needs to find 10 ai generated images and 10 real images and upload the urls to the github repository

On the topic of workflow

- Don't feel pressured to constantly be finishing user stories
- Each person should have a meaningful commit at least 3 times a week
